TITLE: MARKET RESEARCH DATA

If you were investing in a business complete the mind map below to show what information you would want to know before you handed over any money

DIAMOND 9

1= Most Important

9=Least Important

TASK:

Rank in order which of these pieces of information would be the most important when investing in a business

1.		Explanation of why you chose this option as the most important:
2.	3.	
4.	5.	6.
7.	8.	
9.		Explanation of why you chose this option as the least important:

THE USE OF DATA IN MARKET RESEARCH

- What a business does with the data and information collected during the market research process is pivotal to how useful it becomes to them.
- Once the business has collected the data, it's crucial that they analyse, summarise, and present it effectively to identify the key findings and inform decision making.
- However, there are two different types of data that can be collected, analysed, and presented during the market research process, these are:

Qualitative
data

Quantitative
data

CONNECTION

QUANTITATIVE VS QUALITATIVE DATA

[Video link:](#)
[Quantitative vs](#)
[Qualitative Data](#)

QUALITATIVE DATA: Any information which is gathered which includes opinions, feelings or views on something

- Qualitative data allows the researcher to collect the thoughts and opinions of the participants.
- Rather than 'yes' or 'no' questions, qualitative data consists of open questions.
- Requiring participants to expand on their answers, which helps the business to understand the reasons behind the answers given.
- Using qualitative data benefits the business and helps them to make more informed decisions as they have more information and a detailed insight into what customers want and why.
- However, qualitative data is often harder to analyse, conducted with less participants, and requires a skilful person to write and conduct the research.

QUANTITATIVE DATA: Any information which includes statistics and numerical data which can be easily analysed

- Quantitative data uses closed questions i.e. 'yes' or 'no' responses or rankings etc.
- This allows the business to collect vast amounts of data as it typically involves a lot more participants than qualitative data.
- Quantitative data is often used to generate statistics which represent the market numerically e.g. 75% of participants stated they visit a restaurant once a month.
- If a business conducts regular research using quantitative data, it is able to monitor any changes in what customers want and need.
- However, a key drawback of using quantitative data is that it does not provide the business with any reasoning behind the responses of participants.

ACTIVITY: QUALITATIVE AND QUANTITATIVE RESEARCH

Draw a table in your book and place each one of the statements into each category of either Qualitative or Quantitative Research

1. 92% of Tesco customers have a Clubcard
2. 45% of the population of the UK earn over £30,000 a year
3. ASDA customers feel the customer service at stores is poor and needs improving
4. There are 67% of students at QES who are having a Christmas Lunch this year
5. Parents who attended the QE6 open evening felt their was a lot of choice for students to study for their A Levels
6. After being asked about the quality of food at McDonalds, people felt that it could be hotter and portion sizes more consistent.

QUANTITATIVE INTO QUALITATIVE

1. 92% of Tesco customers have a Clubcard
2. 45% of the population of the UK earn over £30,000 a year
3. ASDA customers feel the customer service at stores is poor and needs improving
4. There are 67% of students at QES who are having a Christmas Lunch this year
5. Parents who attended the QE6 open evening felt there was a lot of choice for students to study for their A Levels
6. After being asked about the quality of food at McDonalds, people felt that it could be hotter and portion sizes more consistent.
